### Formulae for Rates

Mathematical definitions used in rate calculations:

---

Age-specific rate:

$$r_i = \left( \frac{c_i}{n_i} \right)$$

where  $r_i$  is the age-specific rate for age and/or gender group  $i$ ,  $c_i$  is the count of cases for that age and/or gender group, and  $n_i$  is the count of persons at risk (i.e., the population) for that age and/or gender group; rates in all tables are presented per 100,000 population.

---

Age-adjusted rate:

$$A.A.R. = \sum_{i=0\&4}^{85\%} (w_i r_i)$$

where  $w_i$  is the proportion of that age group in the standard population.
