CALIFORNIA CANCER REGISTRY FACT SHEET

BREAST CANCER

Breast cancer is a malignant tumor that starts in the cells of the breast.

Breast Cancer Incidence and Mortality Rates, California, 2006–2010

Between 2006 and 2010, the female breast cancer incidence rate for women in California was 122.1 new cases per 100,000 women per year. With respect to race/ethnicity, non-Hispanic white women experienced the highest incidence rate (141.3 new cases per 100,000 women per year).

The breast cancer mortality rate for women in California was 21.8 deaths per 100,000 women per year. With respect to race/ethnicity, while non-Hispanic white females showed the highest rate of new breast cancer cases, African American women experienced the highest mortality rate (33.0 deaths per 100,000 women) in the state.

#1
Breast cancer is the most commonly diagnosed cancer among women in California, regardless of race/ethnicity.

#2
Breast cancer is the second-leading cause of cancer deaths among women in California.

BY THE NUMBERS

Breast Cancer in California

22,850
The number of new breast cancer cases expected among women in California in 2013.

4,340
The number of deaths from breast cancer expected among women in California in 2013.

Overall 5-Year Relative Survival Rate for Breast Cancer in California: 92%

* Follow-up is through December 2010. Cancers that were unstaged at time of diagnosis are excluded.

Risk Factors

Certain factors have been shown to be associated with an increased risk of certain types of cancer. The majority of known cancer risk factors are related to individual characteristics (such as age, race/ethnicity, or family history/genetic susceptibility) and behaviors (such as smoking, diet, physical inactivity, unsafe sex, and sun exposure).
