BY THE NUMBERS
Thyroid Cancer in California

4,835
The number of new thyroid cancer cases expected in California in 2013.

210
The number of deaths from thyroid cancer expected in California in 2013.

#5
Thyroid cancer’s ranking on the list of most commonly diagnosed cancers for California women in 2010.*

Thyroid cancer is a cancer that starts in the thyroid gland. This gland is located at the front of your neck beneath your voice box (larynx). The thyroid produces hormones that regulate the body’s metabolism rate and other systems in the body.

Thyroid Cancer Incidence and Mortality Rates, California, 2006–2010

Between 2006 and 2010, women in California had a thyroid cancer incidence rate that was nearly triple the rate seen in men during that same period (16.1 versus 5.5 new cases per 100,000 persons, respectively). The thyroid cancer mortality rates, however, were nearly the same for men and women in California (0.5 deaths per 100,000 males per year and 0.6 deaths per 100,000 females per year).

With respect to race/ethnicity, non-Hispanic white males and females had the highest incidence rates (6.5 new cases and 17.7 new cases per 100,000 persons, respectively) and Hispanic and Asian/Pacific Islander males and Asian/Pacific Islander females had the highest mortality rates (0.6 deaths, 0.6 deaths, and 1.0 deaths per 100,000 persons, respectively) in the state.

* However, thyroid cancer was not among the top ten causes of cancer deaths (mortality) for women, nor did it rank among the ten most-commonly diagnosed cancers or the top ten causes of cancer deaths for men.

* Rates are age-adjusted to the 2000 U.S. Population.
